Internship & Program Overview

Data Science

INTERNSHIP DOMAIN

10 Weeks

PROGRAM DURATION

AICTE-EduSkills

CERTIFYING PROGRAM

Program Overview

This internship was undertaken as part of the B.Tech CSE curriculum to build practical, industry-relevant skills in data science. Delivered over a 10-week structured virtual program under the AICTE–EduSkills National Internship Portal (Ministry of Education) and supported by Altair, the training progressed through data engineering, machine learning, and applied use-cases, culminating in a verified internship credential graded “Outstanding.”

Organization Overview — AICTE–EduSkills

AICTE–EduSkills National Internship Portal

Ministry of Education Initiative, in partnership with Altair

The Data Science Master Virtual Internship was delivered through the AICTE–EduSkills National Internship Portal, a Ministry of Education initiative under the All India Council for Technical Education, in collaboration with EduSkills (“Nation Building Through Skills”). The 10-week program was supported by Altair, providing structured, hands-on learning in data science with a verified internship credential upon completion.

Program Delivery & Support

Industry Context & Problem Statement

The Industry Need

Organizations across every sector now generate vast volumes of data, driving strong demand for professionals who can turn that data into reliable, actionable insight — from cleaning and structuring raw data to building and deploying predictive models.

The “Data Science” skill set — spanning data engineering, statistical modeling, machine learning, and platform administration — directly addresses this gap, preparing practitioners for real analytics and AI-driven roles.

Problem Statement

Academic curricula often introduce data science concepts in isolated modules, leaving a gap between theoretical statistics and the integrated, end-to-end workflow — data access, cleansing, modeling, validation, and deployment — expected in industry roles.

This internship was undertaken to bridge that gap — building a single, connected understanding of the full data science lifecycle, from raw data to a validated, deployable model.

Internship Objectives

Build strong foundations in data access, transformation, and data cleansing.

Apply advanced data engineering techniques — scripting, regex, macros, and Web APIs.

Master core machine learning: classification, regression, clustering, and scoring.

Develop complex predictive models with cross-validation and parameter optimization.

Apply the CRISP-DM methodology to real-world use cases and visualization.

Gain platform administration skills across the RapidMiner (Altair) ecosystem.

Technologies & Technical Toolchain

Data Science Workflow — CRISP-DM Pipeline

Data flows from raw sources through cleansing, feature engineering, and model building, is validated and optimized, then deployed for real-time scoring — the CRISP-DM cycle applied throughout the internship using RapidMiner (Altair).

Internship Timeline & Learning Path

Demonstrated Skills

Through the RapidMiner (Altair) certification tracks, the following practical, data-science capabilities were demonstrated:

Data Engineering

Accessing, cleansing & transforming raw data with RapidMiner, including regex, macros and Web APIs.

Predictive Modeling

Building classification, regression and clustering models with hold-out and cross-validation.

Model Optimization

Parameter tuning, feature engineering and model selection for complex predictive models.

Time Series & Forecasting

Applying forecasting techniques and integrating R and Python models.

Applied Use Cases

Following the CRISP-DM methodology to frame and visualize real-world use cases.

Platform Administration

Managing RapidMiner Studio, AI Hub, Radoop and real-time scoring deployments.

Key Learning Outcomes

Gained an integrated, end-to-end understanding of the data science lifecycle — from raw data to deployed model.

Developed confidence in data engineering: accessing, cleansing and transforming data using RapidMiner.

Learned to build and validate predictive models using classification, regression and clustering techniques.

Understood parameter optimization, feature engineering and cross-validation for robust model performance.

Practiced applying the CRISP-DM methodology to structure real-world data science use cases.

Built familiarity with platform administration — RapidMiner AI Hub, Radoop and real-time model scoring.

Certification & Official Verification
